Keywords: Database MYSQL

Abstract:

WAP applications are developed by the developer-developer and is used by network operators (eg: Indosat) and the companies that own mobile phones (eg Ericsson), whose goal is to add a service to its users.

As WAP with WML and PHP we already know that it is used to access the information in the Internet world through wireless devices (mobile nature) which of course is different from programming for wired devices that use programming languages such as HTML, which is meant here is the WAP just one of the systems that exist today.

PHP language is combined with WML to create dynamic WEB display means can change at any time coupled with a MYSQL database server which serves to accommodate all the necessary data to be displayed as an information.
