Abstract:

In the world of health, health is a very important thing that is more valuable than anything else that was awarded by Almighty God to someone. Health factors are the main driving factor for improving productivity in daily activities. Therefore, health services should be paid serious attention to the relevant parties, both government and private. Many health field work had been done, so much the health sector jobs that can not be done, such as the completeness of providing accurate data about a patient's history.

At the Meteorological and Geophysics Agency in particular the handling of health issues that performed by the outpatient clinic could not provide missing information quickly because the handling is still performed manually using that data to be integrated into an important information that still need to find some relevant documents for presentation to a data information.

As for the proposed solution is the use of design applications that can provide rapid information on patient data in accordance with a medical history from the beginning the examination, actions, decisions made by the physicians.
