### Abstract:

Lately, the public increasingly critical in obtaining health services especially medical malpractice occurred several times. To provide quality health services as desired so many hospital patients began to implement the management system with good medical record. Other parties such as governments and scientists already feel the usefulness. And to provide quality medical records the desired information it needs to make a design of the development of medical record management information system with computer support.

At several stages of research methods conducted tahapanpengumpulan activities include data, data processing phases and stages of data analysis. From the analysis carried out on the old system then it can be seen that there are weaknesses so far. With the results of this analysis it can be designed and evaluated systems globally. After that created a detailed design that includes also the design of input forms, forms reports, the file structure and specifications program.
