In line with the rapid development of the era, the more problems faced by humans. The necessity to solve a problem quickly, accurately and efficiently is very necessary. Therefore science and information technology is always developed to make it happen. In this paper the author makes a computerized system to process administrative services of two-wheeled motor vehicle servicing in the automotive service by using Visual Basic 6.0 programming language and MySQL database. Programs that exist in this application, include a main menu menu displays the data, the transaction menu, the menu reports. Where there are data menu sub menu input customer data, data goods, mechanical data and data types of service fees. Menu there are sub menu transaction transaction. While there are reports of sub menu print menu and save the receipts, customer data printing sub menu and sub menu print transaction data. Where is the menu of this report is used to display and print reports. The application of this system aims to replace the manual system with a system that has been computerized, with the hope to make way company's work for the better, especially in the administration.
