ABSTRACT

As technology advances and information age, the programming language progress very rapidly, both in usage and in making program.

Programming languages and algorithms necessary if a problem should be solved through computer technology, in order to save time and simplify their use.

In general, before a problem solved through a programming language, first the problem was solved through a flowchart diagram, the tool graphically depiction of the steps and the sequence of procedures of a program. Flowchart to help analysts and programmers to solve the problem into segments that are smaller and help in analyzing alternatives in the operation. Flowchart usually facilitate the settlement of a problem, especially problems that need to be further studied and evaluated.

Keywords: Program, Algorithm, Flowchart
