ABSTRACT

The article talks about the development of left-handed children, about the reasons for their becoming left-handed, about the difference between left-handed and right-handed.

Keywords: lefty, leftism, nervous system, etc.

INTRODUCTION

"Lefty!" Is it good or bad? If we notice a child who is different from others, why do we look at him? However, there is a saying that left-handed children have innate talents. Napoleon, Leonardo da Vinci, Charlie Chaplin, Pablo Picasso, Albert Einstein, Jeanne D., Ark, Bruce Willis and others. The list can be expanded. Every tenth child on Earth is born left-handed. On the contrary, left-handedness is not a "bad habit", but an innate quality.

What is leftism?

According to encyclopedic data, "the left hand is more prone to movement than the right. It depends on the left central nervous system, especially on the location of some nerve centers. That is, the child itself is not left-handed. The body adapts to this habit for various reasons.

The reasons for a person becoming left-handed.

There are two reasons for leftism. The first is walking: paralysis of the right arm, paralysis, etc. convincing reasons. Second: congenital left-sided. This is often inherited. The researchers found that if both parents were left-handed, the children were 50% more left-handed, 16.7% more likely if the father or mother were left-handed, and 6.3% more likely to be left-handed. Be left-handed if the parents were left-handed. Therefore, this hereditary address is often mentioned.

The human brain is divided into two parts. Right and left. The positive part is responsible for the ability to smell, color and taste, and the second part helps to perform functions such as thinking, reading, understanding and reasoning. There is a concept that has been developed so far: the right part of the brain — the left leg — controls the function of the hand, and the left part — the right leg — controls the function of the hand. That's how the left explained their actions. However, in recent decades it has been proven that all parts of the brain help to perform these functions, so the previous opinion is included in the list of negative opinions. However, no evidence has yet been found that unites all scientists. Therefore, it seems to me that it is impossible to draw final conclusions and explain the exact reason.

In the past, there were reports that leftists were expelled from society for the message of the devil and severely punished.

Should leftism really attract the attention of the country?

No, she shouldn't. Because it shouldn't be considered a disease or a habit. You can't be a front for the country. Some say that this is a violation of the child's development, others believe that it is mental retardation. Now we all have our eyes open. The child does not want to be intentionally left-handed. His body demands left-handedness.

How to determine that a child is left-handed?

At the age of 4-4.5 years, a child may not have these symptoms. It is difficult to place toys in the endow, since they hold toys such as dolls and dishes with both hands. Only when he reaches the level of drawing with a pen in his hand, he gradually begins to feel the difference in height. Parents can also watch their children play. Which of the two hands holds the toy, which hand acts as a sponsor? If you notice that the right or left hand is leading, you can see that the left hand tends to act.

There are also parents who want to raise a lefty. Are they doing it right?

Until yesterday, people were trying to raise a lefty. After all, everything is done in order to approach correctly. Previously, parents said they were doing this because they didn't want their children to suffer in the future. Probably correct. However, by this action, the innate organism deviates from the established biological rhythm. It affects the brain, the brain affects other organs. The nervous system gets tired quickly, other symptoms appear, such as insomnia, anxiety, loss of appetite.

Then, after his teachers and parents warned him to always hold a pen in his right hand, he feels worse. Others begin to feel ridiculed. He will feel humiliated because he is not like his peers. As the child grows up, the shortcomings of his mind become obvious. He does not know how to behave confidently in public, has difficulty communicating, quickly loses the ability to make decisions, loses himself as a person. So think for yourself, is it right or wrong to say that the left is right?

The difference between right-handers and left-handers

The difference between them naturally exists. As mentioned above, the right hemisphere is responsible for the actions of the left arm and left leg. And children with well-developed parts of the brain are more monotonous than others. Such people are very talented artists, musicians, in a word, talented. From an early age, he showed a special talent for fine art. Frequent attempts on the part of adults can lead to stuttering or speech delay. Very emotional, short-tempered, but short-tempered. Literary people are rare because they cannot read and write. However, there are politicians who are able to make decisions quickly, who have qualities of foresight that no one can keep up with. Besides, it's too crowded and talkative here. Therefore, it is difficult for a believer to forgive the betrayal of others. He does not accept the lies of his parents. It can be stored inside and not be said goodbye for a lifetime. You can't handle a disaster. You're making the situation worse. It is better to deceive with a game and distract attention.

Since left-handed children are not often seen in society, some parents may not know what to do. There are certain recommendations for them that it is desirable to follow:

Such parents should keep in mind:

- Be patient, given the emotionality, do not give up and do not try to beat;
- Kindness and warmth in the family;
- Do not try to hold the pen and spoon in your right hand;
- Encouragement for every little action;
- If you notice a musical talent, do not try to adapt to the art of painting;

CONCLUSIONS

If you click on every mistake you make, you will suffer from epilepsy.

It doesn't matter if your child is left-handed or right-handed. If the older one is left-handed and the younger one is right-handed, love both equally. After all, it doesn't matter which hand your child writes with – right or left, it doesn't affect anything, he was your child, he will remain that way. The main thing for children is the support and love from their parents.
