THE IRRADIATION OF MALE METHOD OF INSECT CONTROL

by

R. C. von -Borstel

to successfully employ the irra&iation-of-male method for insect control, only three radiation Hersitivityparameter must be Known:

1. To epproximate 99% dominant lothaldose to sperm

- 2. The dose at which the spormatogonial cells can not replenish the testes and replace the nature lethal spermatozoa with now good ones - that is, it is necossary to know the "sterilization" dose for spermatogonia and
- 3- The dose at which true inactivation of sperm takes place.

a dose of radiation should be used that is slightly beyond the first two parameters and below that of the thrid. Wo data are required *on* radiation sensitivity of thc female, and it does not matter how many times the *females* mate, that is, since dominant lethals arc induced, it is a matter of sperm competition and not male competition among the normal and irradiated males.

Recently, in Israel, RACHELZALUN began some irradiation experiments on the tick, Ornithodorus tholazani. she found that after being irradiated with high doses, the ticks would not feed again. Apparently the intestine

+)

will not absorb food in the adult after being irradiated. This discovery opens the way to studying the feasibility of irradiation-of-male method on those insects that ordinarily cause all their damage in the adult stage of the cycle.

the three keys to the wide spread applicability of the irradiation-of-male method for post control are that it can work on any insect to matter how/ many times they mate, and that even insects that are posts as adults can be released after the irradiation without their necessarily causing any damage. Their knowledge makes the irradiationof-malc method justifiable as a research that is all at once basic, applied and current It is the ideal type of irradiation reseach project for invest gators in developing loping nations because it is easy, inexpensive, indispensable for basic knowledge and appleable to the desparate needs of the country. Fortunately, a means of assistance for this kind of research on an international scale exists within the framwork of the United Nations, making all the more a research of choice.
