Program Studi Farmasi Universitas Islam Indonesia

ABSTRACT

This research was aimed at knowing potential drug interactions on drug prescribing for treatment of hospitalized pediatric patients with respiratory tract infection. Research was carried out at a private hospital in Surakarta and data were collected from medical records of patients were hospitalized during January – December 2005. Potential drug interactions were determined theoretically using some literatures on drug interaction. From total 186 patients included in this research, 67.2% were 0-4 years old with common cold was the most diagnosed. There were 52.7% patients receiving 4-6 item of drugs and 76.9% patients were hospitalized during 1-3 days. Potential drug interactions were identified in 30.7% patients with 1.8% and 15.8% of them at level 1 and 2 clinical significance, respectively. Statistically, there was a relationship between potential drug interactions and length of hospitalization ($p = 0.001$). Some further investigations (prospectively) are needed to ensure results from this research.

Key words : drug interaction, respiratory tract infection, pediatric
